6 May 2020 Substantial update 16 May 2020

COVID-19 Dental Services Evidence Review (CoDER) Working Group

Version 1.3 – 16th May 2020 includes 16 countries (5 new added)

Purpose

The COVID-19 pandemic has led to the closure of dental practices or a reduction of dental services all over the world. Some countries are currently reopening or planning to reopen dental services as part of an exit from the lockdown strategy.

In response to the urgent need for guidance, this rapid review has been undertaken to assist policy and decision makers with the production of comprehensive national guidance for their own settings. The review summarises the main themes from recently produced international sources and assesses the extent to which their recommendations were supported by underpinning evidence.

In this evolving situation, information provided by each country may be subject to change.

Key messages

- This review reports on national recommendations for the re-structuring and reopening of dental services from 16 countries.
- There is a highly variable level of detail given across international sources.
- Most sources recommend patient triage by telephone; some recommend also temperature screening at reception.
- Most sources recommend avoiding aerosol generating procedures (AGPs), if possible.
- Most sources recommend surgical masks for non-COVID-19 cases not requiring AGPs.
- Most sources recommend filtering facepiece class 2 (FFP2, equivalent to N95) masks for non-COVID-19 cases undergoing AGPs and all suspected or confirmed COVID-19 cases undergoing any procedure.
- Sources include recommendations on how to reduce the risk of transmission (e.g. use of pre-operative mouthwashes; high volume suction; rubber dam; and Personal Protective Equipment [PPE]).
- Most sources recommend cleaning and disinfection procedures.
- Across sources, for most statements there is no referenced, underpinning evidence and some of them are unlikely to have strong (or any) research evidence.
- All sources emphasise the need to focus on activities that minimise risk (to staff/patients/public) but still support high quality clinical care.
- There is a need to consider the inter-relationship between the appropriate use of PPE (including donning and doffing), AGPs and interventions to reduce aerosol generation.

Background

The World Health Organisation (WHO) declared the coronavirus disease (COVID-19) outbreak as a public health emergency of international concern on the 30 January 2020 and a global pandemic on the 11 March 2020.

COVID-19 spreads primarily through droplets and fomites. The close working environment and the potential for aerosol spread of the virus through dental procedures, such as use of high and low-speed handpieces, ultra-sonic scalers, air/water syringes, intra-oral radiographs or an infected patient coughing, places dental health workers at an elevated risk of infection.

Pandemic planning for dental services typically involves a step-down process, with cancellation of routine care first, then urgent care followed by the provision of emergency care only. In many countries, the move to emergency care provision was rapid. For example, on the 16 March 2020 the American Dental Association proposed that dentists defer all elective dental care for 3 weeks; in Scotland, Wales and Northern Ireland, all aerosol generating practices were stopped on the 17 March and practitioners were told to stop all routine face-to-face dentistry on the 23 March. On the same day in New Zealand, all non-essential and elective dental treatment was suspended. By the end of April 2020, National and Regional Governments and professional organisations had published recommendations or guidance for the re-opening/re-structuring of dental services.

Process

Between the 2 and 13 of May 2020, we conducted a rapid review of recently produced guidance and reports containing recommendations from international organisations and professional bodies on the current requirements for the re-opening of dental services. Our methods were based on the proposed approach for rapid reviews by the WHO and the Alliance for Health Policy and Systems Research.¹

We conducted a grey literature search to identify relevant guidance documents and liaised with the information scientist of Cochrane Oral Health (COH), who last updated the regular Cochrane search for dental guidelines on the 11 May 2020 (search strategy available on request). We searched websites of dental organisations and departments of health. We also contacted an international network of oral health researchers and decision makers through the Global Evidence Ecosystem for Oral Health (GEEOH). The GEEOH was founded to reduce duplication of effort and create direct routes from evidence to policy and clinical practice and is currently coordinated by COH. The relationship between COH, the Scottish Dental Clinical Effectiveness Programme (SDCEP) and our research group resulted in rapid communication and assistance from several Chief Dental Officers and worldwide dental policy leaders. No language restrictions were applied to the searches and members of our research group were able to translate documents published in non-English languages.

¹ https://www.who.int/alliance-hpsr/resources/publications/rapid-review-guide/en/ Page **3** of **45**

From the identified sources of information, we selected those that provided the most recent and relevant recommendations for the re-opening of dental services. To be eligible, guidance and recommendations needed to have explicitly addressed resuming dental care provision post initial closure or restriction due to COVID-19 outbreak, in any area or setting where clinical practice was limited to prevent community infection. National guidance, where available, was prioritised over regional or local guidance. Due to the time constraints in the preparation of this rapid review, we conducted single data extraction and did not formally assess the quality of the guidance documents or validate their sources. Attempts to link recommendations to underpinning evidence were noted.

Prior to the extraction of information/data, the research group reviewed a sample of these sources to identify common domains for policy making across reports. We used these categories to structure our analysis and present our findings.

Findings

We identified a total of 17 guidance documents from 16 countries produced between 18 March and 11 May 2020. The list of countries and details of the documents are presented in Appendix 1. We summarised the common themes and the relevant recommendations in the five domains included within the guidance documents. The five domains identified were:

- 1. Practice preparation and patient considerations.
- 2. PPE for dental practice personnel.
- 3. Management of the clinical room.
- 4. Dental procedures.
- 5. Post-operative cleaning/disinfection/waste management.

The level of detail across international sources varied greatly. It is important to highlight that (1) the absence of a recommendation from a particular source does not imply its lack of importance and (2) that different national approaches are due to different epidemiological situations and public health approaches. For the majority of recommendations addressing specific COVID-19 concerns there was limited or no referenced, underpinning evidence.

1. Summary of recommendations related to practice preparation and patient considerations

Theme	Recommendations
Re-opening tasks	• 3/17 (18%) sources include general tasks such as how to reduce risk of contamination e.g. legionella, staff training and machine and equipment maintenance (e.g. IT).
Supply chain	 2/17 (12%) sources recommend confirming the availability of supplies including PPE.
Staff advice and screening	 10/17 (59%) sources provide a range of advice or training in revised protocols including checking that staff are free of COVID-19 symptoms. 2/17 (12%) sources recommend the daily screening of temperature.
Patient triage	• 16/17 (94%) sources provide information on how to group patients mainly by telephone to include risk assessment of potential COVID-19 status (e.g. COVID-19 positive, suspected COVID-19, asymptomatic, special need/shielding). Some also recommend temperature screening at reception.
Patient advice	• 7/17 (41%) sources provide information on what type of advice to provide to patients attending the surgery (e.g. social distancing, wearing mask, hand hygiene).
Patient scheduling	 9/17 (53%) sources recommend clear scheduling of patients based on triage. Patients who are vulnerable or with special needs: 2/17 (12%) sources consider the scheduling of appointments to avoid contact with higher risk patients. 1/17 (6%) source indicates that patients' appointments should be spread between 20-30 minutes to allow for enough time to disinfect all areas and avoid cross infection between patients in waiting rooms.
Waiting area reception	• 15/17 (88%) sources consider social distancing, rearrangement of furniture, protective shields, patient information posters, wearing of masks, hand sanitiser, removal of magazines/toys and other unnecessary items.
Toilets	 2/17 (12%) sources advise patient use of the toilets only with permission.
Patient discovered COVID-19 positive after treatment	 1/17 (6%) source suggests contact tracing and isolation of close contacts (i.e. dental staff providing treatment).

Theme Recommendations All staff 11/17 (65%) sources indicate that all staff should wear a face • mask at all times. • 6/17 (35%) sources indicate that all staff should wear eye protection at all times. • 7/17 (41%) sources indicated that all staff should wear dedicated working uniform. • 2/17 (12%) sources indicate that work uniforms should be laundered on site or by laundry service. Unsuspected 17/17 (100%) sources recommend eye protection • COVID-19 patients (glasses/goggles, face shields) and single use gloves. • 14/17 (82%) sources recommend use of surgical masks with 2 of them recommending higher specification if available. • 3/17 (18%) sources recommend use of FFP2 masks or equivalent. • 5/17 (29%) sources recommend disposable gowns or equivalent. • 3/17 (18%) sources recommend single use aprons or equivalent. • 5/17 (29%) sources recommend use of surgical hats or equivalent. • 3/17 (18%) sources recommend shoes protection. Unsuspected • 6/17 (35%) sources recommend use of surgical masks with 1 COVID-19 patients of them recommending higher specification if available. undergoing AGPs • 10/17 (59%) sources recommend use of FFP2 masks or equivalent. • 11/17 (65%) sources recommend disposable gowns or equivalent • 5/17 (29%) sources recommend single use aprons or equivalent in addition to gown. 6/17 (35%) sources recommend use of surgical hats or equivalent. Suspected or • 3/17 (18%) sources recommend use of surgical masks with 1 confirmed COVIDof them recommending higher specification if available. 19 patients • 9/17 (53%) sources recommend use of FFP2 masks or equivalent. • 2/17 (12%) sources recommend use of FFP2 or FFP3 masks or equivalent 1/17 (6%) sources recommend use of FFP3 masks or

2. Summary of recommendations for PPE for dental practice personnel

	 2/17 (12%) sources recommend double gloving. 8/17 (47%) sources recommend disposable gowns or equivalent. 7/17 (41%) sources recommend use of surgical hats or equivalent. 2/17 (12%) sources recommend shoes protection.
Suspected or confirmed COVID- 19 patients undergoing AGPs	 1/17 (6%) source recommends use of highest available mask up to FFP2 or equivalent. 10/17 (59%) sources recommend use of FFP2 masks or equivalent. 3/17 (18%) sources recommend the use of FFP2 or FFP3 masks or equivalent. 2/17 (12%) sources recommend use of FFP3 masks or equivalent.

3. Summary of recommendations for management of the clinical room

Theme	Recommendations
Use of spittoon	• 3/17 (18%) sources state that the spittoon should not be used in dental units.
Clear work surfaces, minimise equipment and cross infection procedures	 8/17 (47%) sources provide information on how the work surfaces in the clinical room should be kept clear. Examples include limiting paperwork, covering notes with a barrier and removal of artwork. This also extends to ensuring all equipment in sight should be minimised to only that which is strictly necessary to avoid viral cross-contamination. All required equipment/materials should be prepared in advance. 5/17 (29%) sources indicate that common contact areas such as the chair lamp, handles and keyboard should be covered with a barrier (e.g. plastic film or aluminium foil). 2/17 (12%) sources indicate that supporting staff outside the room should bring in clean instruments and necessary materials.
From waiting area to treatment room	 2/17 (12%) sources recommends switching between different treatment rooms if possible, especially following AGPs. 1/17 (6%) source reminds dental staff that there should be no handshaking or contact with patients. 5/17 (29%) sources recommend keeping staff levels/entry to a minimum in surgery. 2/17 (12%) sources indicate that staff should have all the PPE on before they enter into a treatment room.

Suspected or confirmed COVID-19 patients	 1/17 (6%) source indicates that suspected or confirmed COVID-19 patients should be directed to the treatment room and should not be allowed to wait in the waiting area. 1/17 (6%) source indicates that patient treatment should be undertaken in an isolation room with negative pressure.
Home visits	• 1/17 (6%) source indicates that all patients should be asked about symptoms of COVID-19 and social distancing and appropriate cross infection control should be adhered. This includes cleaning of contact surfaces in the patient's home and contact surfaces in the dentist's car.
Air quality	 9/17 (53%) sources acknowledge the importance of ventilation/air renovation of which 4/17 (24%) guidance documents state between 15-30 minutes is required after each patient for ventilation. 3/17 (18%) sources mention air conditioning. 1/17 (6%) acknowledges that there is no consensus on the use of air conditioning but states that if used, the filters should be changed weekly; 1/17 (6%) recommends that air conditioning should be switched off; and 1/17 (6%) recommends use of air conditioning in extraction mode only (never in recirculation mode). 1/17 (6%) source indicates that a HEPA filter (level 13 or higher) should be used for the suction system. 5/17 (29%) sources indicate that the door of the surgery must remain closed to prevent viral spread. One guidance document expands on this to state all drawers and cabinets should also remain closed.
Patient hygiene	• 2/17 (12%) sources provide information on general patient hygiene in the clinic. For example, patients are requested to disinfect their hands at arrival, should be supplied with appropriate protection (e.g. plastic bib, eye protection) and must perform hand hygiene on completion of treatment and leave the room as soon as possible.
Post-treatment	 1/17 (6%) source indicates that dental staff should leave the treatment room and then remove their visor, eye protection and masks. 1/17 (6%) source recommends the disposal of surgical gowns and aprons into a sealed plastic bag.

4. Recommendations for dental procedures

Theme	Recommendations
Reduction of AGPs	 17/17 (100%) sources include recommendations to reduce or avoid AGPs. 1/17 (6%) source recommends avoiding using the air-water (3-in-1) syringe.
Risk reduction interventions	 17/17 (100%) sources include recommendations on how to reduce the risk of transmission. 15/17 (88%) sources recommend rubber dam and high volume suction 14/17 (82%) sources recommend the use of pre-operative mouthwashes
High volume suction	 16/17 (94%) sources recommend aspiration to specifically decrease viral load generated by aerosols. 1/17 (6%) source indicates that the aspirator tip should be covered with a disposable cover.
List of recommended operative procedures	 6/17 (35%) sources explicitly recommend minimally invasive procedures. 5/17 (29%) sources include a defined list of procedures that can be carried out.
Tailored advice for patient groups	• 10/17 (59%) sources provide specific advice for different patient groups (e.g. COVID-19 asymptomatic; shielded groups; suspected or confirmed COVID-19 positive patients).

5. Summary of recommendations related to post-operative cleaning/disinfection/ waste management

Theme	Recommendations			
Cleaning and disinfection procedures	 11/17 (65%) sources recommend cleaning and disinfection of all surfaces following every patient contact. 11/17 (65%) sources recommend cleaning and disinfection of all non-clinical areas (reception, waiting area, toilets) including door handles, chairs, and surfaces. 2/17 (12%) sources recommend clinical floor cleaning ranging from 2-3 times daily. 2/17 (12%) sources recommend door should remain shut and air to settle for period of time (range: 20-120 minutes) 			

PPE during decontamination	 5/17 (29%) sources indicate that staff should wear eye protection, gloves and mask when performing decontamination/disinfection procedures. 3/17 (18%) source recommends washing of garments at the highest possible temperature (at least 60 degrees for 30 minutes or between 80 and 90 degrees with 10 minutes of heat contact with clothes). 2/17 (12%) sources recommends scrubs be laundered on site or by contracted service
Clinical waste disposal	 5/17 (29%) sources recommend waste be disposed of as per regulations of local system. 4/17 (24%) source recommend PPE and other disposable contaminated material should be placed in a hard-lid container. 1/17 (6%) source recommends double-bagging and storing clinical waste before evacuation
Disinfection products	 1/17 (6%) source recommends disinfection products for surfaces, suction and instruments must mention 'viricide agents' (EN 14476). 4/17 (24) sources recommend a hypochlorite/chlorine-based solution for disinfection. 4/17 (24%) sources recommend the use of alcohol (60-70% ethanol) for disinfection. 1/17 (6%) source recommends the use of chloroxylenol (0.12-0.24%) for disinfection. 1/17 (6%) source recommends the use of Virkon[®], Perasafe[®] as disinfectants.
Existing policies on decontamination	• 3/17 (18%) sources refer to national guidelines for disinfection and decontamination policies.
Hand washing	 4/17 (24%) sources recommend hand hygiene following doffing of PPE/decontamination of environment. 1/17 (6%) source recommends hand washing with alcohol (60-95%) based hand rub or soap and water for at least 20 seconds.

Conclusion

This rapid review provides an overview of the international guidance documents on the reopening of dental services published to date. It summarises the main elements of the identified documents and highlights several key messages intended to assist policy and decision makers to produce comprehensive national guidance for their own settings. Across international documents, for most of the statements addressing specific COVID-19 concerns, there was limited or no referenced, underpinning evidence.

Working Group Members

Jan Clarkson , Clinical Lead	Professor of Clinical Effectiveness, University of Dundee; Director of SDCEP, NHS Education for Scotland (NES); Joint- Coordinating Editor, Cochrane Oral Health, University of Manchester
Craig Ramsay , Methods Lead	Professor and Director, Health Services Research Unit (HSRU), University of Aberdeen
Magaly Aceves	Research Fellow, HSRU, University of Aberdeen
Miriam Brazzelli	Reader, HSRU, University of Aberdeen
Thibault Colloc	Dental Core Trainee, Oral and Maxillo-facial Surgery, Aberdeen Royal Infirmary, NHS Grampian
Manas Dave	NIHR Academic Clinical Fellow in Oral and Maxillofacial Pathology, University of Manchester
Anne-Marie Glenny	Professor of Health Sciences, Joint-Coordinating Editor, Cochrane Oral Health, Division of Dentistry, University of Manchester
Beatriz Goulão	Statistical Research Fellow, HSRU, University of Aberdeen
Thomas J Lamont	Clinical Research Fellow/Hon. StR in Restorative Dentistry, School of Dentistry, University of Dundee
Derek Richards	Specialist Advisor, SDCEP, University of Dundee
Clare Robertson	Research Fellow, HSRU, University of Aberdeen
Gavin J Wilson	Chief Dental Officer's Clinical Fellow, NHS England and NHS Improvement; StR in Oral Surgery, Leeds Dental Institute

The COVID-19 Dental Services Evidence Review Working Group would like to thank and acknowledge the contribution of the following individuals for providing the advice and access to the international guidance documents necessary for this rapid review:

Colette Bridgman, Chief Dental Officer, Wales; Alonso Carrasco-Labra, Director, ADA Science & Research Institute; Riana Clarke, National Clinical Director Oral Health, New Zealand; Michael Donaldson, Chief Dental Officer, Northern Ireland; Tom Ferris, Chief Dental Officer, Scotland; Sara Hurley, Chief Dental Officer, England; Marco Landi, Council of European Dentists; Timothy Ricks, Chief Dental Officer, US Public Health Service; James Taylor, Chief Dental Officer, Canada; Benoit Varenne, Dental Officer, World Health Organization.

The COVID-19 Dental Services Evidence Review Working Group are grateful for the help and support provided by Shona Floate, University of Glasgow; Anne Littlewood, Laura MacDonald and Helen Worthington from Cochrane Oral Health; David Felix, Postgraduate Dental Dean, NES and colleagues from NES's Clinical Effectiveness workstream: Samantha Rutherford; Douglas Stirling; Michele West; Linda Young.

Reference	Practice preparation and patient considerations	PPE for dental practice personnel	Management of the clinical room	Dental procedures	Post-operative cleaning/disinfection/waste management
Country: Spain Source: Council of Dentists and Collegial Organization of Dentists Date of publication: 13.04.2020 Latest update: 01.05.2020 https://www.con sejodentistas.es comunicacion/a ctualidad- consejo/notas- de-prensa- consejo/item/17 33-plan- estrategico-de- accion-para- clinicas- dentales- durante-el- beriodo-de- desescalada.ht ml	 Reopening surgery Clinical staff health status needs to be checked and staff to receive appropriate training on protocols, procedures, and materials. If possible, do a simulation prior to the arrival of patients. Reception area Cleaning of shoes. Methacrylate screen in the patient reception area. Visible line to indicate a security distance of approximately 1.5 meters from reception desk. Person at the reception should wear a surgical mask and, if possible, glasses. Waiting room Remove all unnecessary items such as decorations, coffee makers, magazines, books, etc. Chairs placed in a way to respect social distancing and at least 2 metres apart. Toilets Remove bathroom towels or hand dryers and replace with paper. Provide instructions on proper hand washing. Patient advice With the exception of children and persons in need, patients should come alone. Avoid wearing jewellery or accessories. Mobile phones must be stored and not used in the dental practice. 	 All staff Reception staff should wear a surgical mask and, if possible, glasses. Non-AGPs Single use of FFP2 masks without valve for up to 4 hours. Possible to re-use the mask after sterilization if not damaged (2 or 3 sterilizations permitted). Dealing with a symptomatic patient: no need of a mask if 2 meters away; use of surgical mask if 1 to 2 meters away; use of FFP2 mask if <1 meter away. Double pair of nitrile or latex gloves. Eye protection Waterproof disposable gown, cap, and shoe covers Avoid wearing rings, bracelets, pendants, watches, or other accessories AGPs Shoe cover Hand hygiene (for at least 40 seconds) Protective gown, disposable cap, and gloves, mask, and eye protection Avoid touching your face and surrounding surfaces while wearing PPE. 	 Minimise equipment <u>Before the patient enters:</u> Organise the strictly necessary material and instruments, and PPE. Avoid viral cross- contamination by placing unnecessary material or instruments out of sight. The placement of plastic or aluminium film in certain areas (those considered to be at greater risk of splashing or aerosols) can be useful. All common contact areas of the equipment (e.g. chair lamp handle, etc.) should be covered with plastic film (or aluminium foil) between patients visits. Closed clinic rooms Door of the clinic must be closed to prevent viral spread that may occur during treatments. Patient preparation Before starting any procedure, patients should disinfect their hands, wear a disposable gown and for those interventions that generate aerosols eye protection. Use only disposable cups. Air quality During aeration, no drafts should occur (close door). 	Tiered procedure levels Level of severe restrictions (A) corresponding to the lockdown period Urgent Care. Assess severity of the patient. Address severe pain, inflammation and/or infection, severe trauma, major postoperative bleeding. Professional criterion: Any activity that in the dentist's opinion should not be delayed. Level of important restrictions (B) the first deescalating phase Minimally invasive restorations, restorations that do not require high-speed use using absolute isolation and specific indications. Do not generate aerosols or, if necessary (emergencies), minimise them, always with a rubber dam. Extractions (preferably non-surgical). Manual scaling (not ultrasonic or sonic), manual periodontal procedures without carving. Professional assessment of urgent endodontic procedures (with absolute isolation, prior disinfection of the consumer, preferably with sodium hypochlorite). Professional assessment of some implantology procedures without high speed. Assess relevance of sealants in all medical or preventive procedures and orthodontic	Cleaning and disinfection procedures Use thick gloves for cleaning and disinfection. The use of a double pair of gloves is recommended. Once the treatment is finished, remove the external pair keeping the internal pair until completion of the collection, transport, cleaning and disinfection of material and instruments. Doffing procedures after treatment and general hygiene Glove hygiene (for at least 20 seconds), remove the gown trying not to touch the clothes, remove the external pair of gloves, then remove the glasses, disposable caps, masks, and the internal pair of gloves. Then wash your hands. Cleaning and disinfection protocol: Surfaces must be disinfected after patient contact and all instruments should be sterilised. The floor of the clinical area must be cleaned at least 3 times: at the beginning of the morning, at noon and at the end of the working day. Protective glasses and screens must be disinfected between patients. Cleaning and disinfection of the clinic at the end of the day

Country: Portugal Source: Direcao Geral da Saude (DGS) (Directorate- General of Health) Date of publication: 01.05.2020 https://www.dgs .pt/directrizes- da- dgs/orientacoes -e-circulares- informativas/ori entacao-n- 0222020-de- 01052020.aspx	 Practice reopening general advice Ensure that all professionals are informed about this plan. Ensure patients have access to information related to respiratory good practice, hand hygiene and mask use. Reception area Remove all unnecessary items such as decorations, coffee makers, magazines, books, etc. Promote the circulation of air in the waiting room, preferable with windows and doors opened. Protect surfaces that might be exposed to hand contact with plastic barriers or aluminium foil that is disposable (e.g. lamp handle, rotating instruments etc.). Ensure surgical masks are available and an alcoholic solution at the entrance of the clinical practice. The mask should be used in the reception and waiting room and should only be removed once the patient is in surgery. Patient triage Triage prior to the appointment. Prior to the appointment, a remote triage should be done to assess whether the patient has symptoms compatible with having COVID-19: new cough 	All staff The receptionist should have a surgical mask, safety spectacles, face shields, clinical uniform, and shoes. Non-COVID-19 patients Oral health professionals should use PPE according to the risk of the procedures undertaken during the appointment. Oral health professionals involved in seeing patients should use PPE according to the Norm 007/2020 from the DGS. COVID-19 patients For high risk procedures (aerosol generating) or for patients with suspected or confirmed COVID-19 in emergency situations: - Surgical Apron – open in the back, disposable, waterproof with long sleeves and that sits below the knee - Mask FFP2 (N95) or FFP3; - Safety spectacles or face shields (with inferior opening) - Gloves – disposable and non- sterilized - Hairnet - Safety shoes For high risk procedures, the use of a double pair of gloves (long sleeve) or a full protection suit. For low risk procedures (that do	Before the appointmentPromote air circulation, preferably by opening windows.Disinfect surfaces, particularly those that are touched frequently, according to Guidance 014/2020 from the Chief Medical Office.Minimise equipment Prepare in advance all the material you expect to use to avoid the circulation of people and the opening of drawers.Clear works surfaces Remove all jewellery and accessories to see patients.Staff general hygiene Keep nails clean and short. The use of acrylic nails, shellac, nail varnish or any other nail products is not permittedAfter treatment/room decontamination Clean and disinfect immediately all surfaces and work environment. Renovate the air at the end of each appointment.Assure effective disinfection of models and moulds. Follow all universal principles	 AGPs Risk of dental procedures to COVID-19 transmission. All procedures that generate aerosols are considered high risk, including root canal treatments and all activities using rotating instruments (polishing included) or an air- water syringe. During the appointment: Avoid, whenever possible, aerosol generating procedures. Instruct the patients, before any procedure, to mouth wash for 30 seconds with a hydrogen peroxide solution 1% or iodopovidone 0.2%. Use surgical suction to decrease aerosol generation. Use rubber dam when appropriate. Use rotation instruments with non-return valve 3 and disposable protections. Prioritise extraoral radiographs compared with intraoral. 	Cleaning and disinfection procedures Cleaning and disinfecting all surfaces outside the surgery must be undertaken with 1 to 2-hour breaks. Cleaning and disinfection of all surfaces in the surgery must be done after every appointment. Reusable material Reusable spectacles or googles must be disposed in a disposable board and sprayed with alcohol 70 degrees or immersed in a chlorine solution as indicated by Guidance 014/2020 from the DGS. Face shields must be sprayed with alcohol 70 degrees in a disposable board. Laundry Garment parts of PPE that are washable must be removed carefully, without shaking them, from inwards to outwards, and put into a waterproof bag. They must be washed at the highest temperature possible. If the garment cannot be washed with hot water, it must be washed in washing machine, at 30 to 40 degrees

In case of supply difficulties, disposable plastic aprons covering the neck can be used. If disposable plastic apron is not available, it can be changed to clean clinical clothing after each patient. The clinical clothes should be washed as specified in NIR for dental clinics, if applicable. Instructions can be prepared locally for the removal of clinic clothes, if applicable using a short video.	protective equipment as specified in the section " <i>Reg.</i> <i>dental protective equipment</i> ". Contact surfaces (e.g. countertop) in the patient's home should be cleaned before leaving the home. Contact surfaces in the dentist's car, including steering wheel, gear lever and handbrake (for bicycle handlebar and saddle) is sanitised after each visit.	For patients who have not been tested for SARS-CoV-2 prior to aerosol-generating procedures, the National Board of Health's principle of precaution should be taken. The use of a 3-in-1 syringe/handpiece should be limited and drying must be effected by effective suction and the use of cotton wool etc. Dental treatment such as fillings and root canal treatment that necessitate the use of an air rotor, turbine,	
	Personal hygiene - access to hand spirit in waiting room if possible and request patients adhere to good hand hygiene	Mask and eye protection Visor or goggles can be multiple use, cleaned and disinfected (according to the manufacturer's instructions) between each patient. In case of supply		handpiece and angle piece should not be undertaken unless it is an emergency that cannot be postponed until after test results for SARS-CoV-2. For emergency treatment,	
	Staff screening Dental staff should pay special attention to their own symptoms and stay home or be sent home immediately with symptoms of COVID-19 (fever, cough, sore throat, headache and muscle	difficulties, full-face visors can be used alone (except for surgical procedures). Ordinary glasses and magnifying glasses can be used if they are designed for protection. Mask should be tight-fitting and		effective saliva suction should be used with assistance [four- handed dentistry] and rubber dam used when it is technically feasible. At the end of treatment, the treatment room must be briefly ventilated before the next patient.	
	soreness, which may be accompanied by nasal symptoms). Dental care personnel can return to work 48 hours after symptom relief. Personnel with mild respiratory symptoms may be tested by their own physician or medical officer.	cover nose and mouth. The mask must retain at least 98% of microorganisms (type II), but does not have to be R type. As masks become leaky when moistened, they must be changed regularly and always		Dental cleaning (scale and polish/scale and root planning) and the treatment of periodontitis must be done with the use of hand instruments.	
	Patient triage Patients with respiratory symptoms where COVID-19 may be suspected or patients with	after each patient.		Prescribing Prescribing antibiotics and painkillers after conducting an individual telephone assessment of the patient:	

Reference	Practice preparation and patient considerations	PPE for dental practice personnel	Management of the clinical room	Dental procedures	Post-operative cleaning/disinfection/waste management
	 proven COVID-19 should not be treated in [primary dental clinics] but should be referred to hospital Patients should not be referred for treatment which is usually performed in the primary sector which is not acute/critical. For Dental, Oral and Oral Surgery that is acute/critical, the patient can be seen once symptom free for 48 hours. Asymptomatic patients requiring AGPs or other procedures that are considered to pose a special risk in dental care, may be prescribed a test for SARS-CoV-2. The test can be prescribed by the dentist or dental hygienist. The test responses should be available prior to scheduling. If the test is positive for SARS-CoV-2 prior to scheduled procedure, the procedure is postponed. The patient should be informed to self-isolate for 7 days according to recommendations and if symptoms appear within the 7 days, the patient must self-isolate for 48 hours after symptom cessation. 			 Painkillers for short-term treatment (up to a couple of weeks in minimum packs), where milder preparations prior to prescription have not proved sufficiently successful. Prescription antibiotics where it is obvious that infection is not due to any other disease that falls within the medical field Dental treatment of children and adolescents Midazolam - children and adolescents who have no symptoms of infection or are infected with COVID-19, Midazolam use should follow existing guidelines followed. Nitrous oxide can be used provided that the hoses are always be retreated properly with cleaning and disinfection. Disinfection with heat is preferred. Alternatively, if possible, disposable hoses may be used. 	
	 Patient scheduling telephone and video consultations should be used where possible It is essential that there is easy access to telephone contact with the dentist; there may be a need to extend telephone time. Electronic scheduling must not be possible. 				

Reference	Practice preparation and patient considerations	PPE for dental practice personnel	Management of the clinical room	Dental procedures	Post-operative cleaning/disinfection/waste management
	 Plan fewer appointment times so that there is a lower daily patient flow in the clinic and fewer patients in the waiting room. Assessments should focus on whether dental work can be postponed without affecting morbidity, taking into account: seriousness and severity of the disease / condition; risk of exacerbating the disease if not treated, including increase drug consumption; risk of the disease / condition becoming chronic if not treated; impact on quality of life; influence on function and / or ability to work When booking consultations advice should be given to not show up with symptoms of COVID-19 (fever, cough, sore throat, headache and muscle 	personnel	clinical room		
	soreness, which in some may be accompanied by symptoms from the nose). - Vulnerable patients (those at risk of greater COVID-19				
	severity) should not be scheduled for examination or treatment in clinics where aerosol-generating procedures have just been performed.

	patient's responses in their record. Someone who has recovered from COVID-19 infection is classified as a low risk patient. If the patient has COVID-19 or symptoms of COVID-19, manage the patient as a 'high risk patient'. You can provide only urgent or emergency care for these patients, defer all other care.				Perform hand hygiene thoroughly up to elbow level.
	High risk patient: • Schedule and manage the patient in a way that minimises face-to-face interaction with others (e.g. at the end of day or session).				
	 Waiting areas All unnecessary items should be removed from the waiting room Separate waiting room chairs by at least 2 metres. Clean surfaces and high-touch surfaces regularly with a detergent or ready detergent wipes. Areas of known contamination should be cleaned and disinfected as described in the Dental Council's Transmission Based Precautions – Cleaning section contained in the Infection Prevention and Control Practice Standard. 				
Country: India Source: Dental Council of India Date of publication: 07.05.2020	Reception/waiting area - Hand wash at arrival. - Patients and any companion should wear masks to attend practice and avoid wearing jewellery or accessories. Masks and shields should be provided when possible.	All staff -Train staff on how to follow established protocols. -Avoid face touching and carefully remove PPE after each procedure. - Staff members should change from personal clothing to scrubs and vice versa before entering	Clinical room - Limit paperwork in the operatory as much as possible Minimise staff in operatory. Equipment - Ban use of spittoon on dental units.	Procedures triage should focus on the provision of advice, analgesia, and antimicrobials. Non-emergent or cosmetic treatment should be postponed.	Cleaning and disinfection procedures - Clean and disinfect public areas frequently, including common and working areas. - All instruments need to be disinfected, cleaned, and sterilised as per standard protocols.

Reference	Practice preparation and patient considerations	PPE for dental practice personnel	Management of the clinical room	Dental procedures	Post-operative cleaning/disinfection/waste management
http://www.dciin dia.gov.in/Admi n/NewsArchives /Dental%20Clini cs%20Protocols %20Final.pdf	 Patients' temperature should be taken at arrival and they should be checked for any COVID symptoms. If any, they should be referred to a government hospital or designated hospital. COVID-19 patients should be seen after viral clearance is confirmed by primary care doctors. Physical/Social distancing should be maintained in clinical areas. Avoid receiving cash payments. Protective screens for reception desks. Limit use of waiting area. Tissues, hand sanitizer and soap should be available. Display health awareness posters regarding COVID-19 Patients triage in groups Emergency (increased patient's death risk) Urgency (requires priority care but do not increase the patient's death risk) Non-emergency (patients which treatment can be postponed). 	 the dental practice and before returning home. Observe frequent hand hygiene. PPE protocol should be followed (including instructions for removal of PPE) Non-AGPS Goggles and face shield (fitted goggles with a soft tissue seal) Triple layer surgical mask N95 respirator during routine dental procedures Disposable gowns Shoe covers Head cap Surgical gloves AGPs Goggles and face shield (fitted goggles with a soft tissue seal) Triple layer surgical mask N95 respirator during routine dental procedures Disposable gowns Shoe covers Head cap Surgical gloves AGPs Goggles and face shield (fitted goggles with a soft tissue seal) Triple layer surgical mask N95 respirator during routine dental procedures FFP3 – standard mask should be used during treatment of COVID19 positive patients. Surgical gloves Disposable and waterproof gown (gown maybe improvised but needs to be changed after each patient). Shoe covers 	 Usage of saliva ejectors is recommended, since can reduce the production of droplets and aerosols. Air quality Adequate ventilation is advised. If dental offices are equipped with the capability, local exhaust ventilation should be used to capture and remove mists or aerosols generated during procedures. Use directional airflow, (e.g. fans), to ensure that air moves through staff working areas before patient treatment areas. 	 Pre-operative and post-operative infection control protocols should be followed. AGPs Avoid or minimise operations that can produce droplets or aerosols. If patient needs aerosol-based treatment, detailed medical history and contact history should be recorded. Patients should be scrubbed with Iso Propyl alcohol extra orally prior to any dental procedure. Pre-procedure rinses like 1% hydrogen peroxide should take place when the patient is conscious. Four-handed technique recommended. After the patient leaves the treatment room, all hand instruments should be cleaned immediately. 	 Perform as many tasks as possible in areas away from patients. Ensure dental unit waterlines are flushed, disinfected using appropriate organic disinfectant and drained Remove visible pollutants completely before disinfection. Equipment (e.g. keyboards) should be covered with a disposable, flexible, clear barrier (e.g. plastic wrap), which needs to be changed between patients. Fumigation of clinics periodically is advised. Sterilise and oil hand pieces, store upright in a clean dry environment. Remove couplings and air motors from tubing. Suction pumps should be flushed with chemical cleaning solution. Clinical waste disposal PPE should be judiciously used and appropriately disposed as per cleaning protocols. Change the surgical mask after every dental procedure. All waste pertaining to patient care should be carefully disposed as per the Bio Medical Waste (Management and Handling) Rules.
